Rapid HIV Antibody Test Result Example

Client Name/ID #: ___________________________ Collection Date: __/__/____
Tester Initials: ______
Clients Date of Birth: __/__/____ Race: ______ Gender: ______
Risk Factors and/or why HIV test is requested (i.e.: MSM, opt-out testing, PEP)?

__________________________________________________________
Name of Authorizing Physician ________________________________

The HIV-1/2 antibody result from the Rapid HIV Antibody Test is:

Non-Reactive (Negative)  Reactive (Preliminary Positive)  Invalid

☐  ☐

Type of Specimen: Finger stick (Whole Blood) ☐
Oral Fluid Specimen ☐

Meaning of the test result:

A non-reactive (negative) test result means that no antibodies to HIV-1 have been detected. HIV antibodies may be absent during the “window period” of infection. Follow-up testing may be necessary if indicated by risk factors.

A reactive (preliminary positive) test result suggests that antibodies to HIV-1 may be present in the blood obtained from a rapid, finger stick test with whole blood. A specimen will have to be sent to a laboratory for a Western Blot test prior to confirmation of the reactive test result. Precautions should be taken to avoid the chance of spreading HIV.

An invalid test result resulting from a rapid finger stick can be due to a problem running the test or an interfering substance in the specimen. A specimen using other testing technology should be collected and submitted to a laboratory for HIV testing.

Questions: If you have any questions about the rapid test result, please contact the Authorizing Physician.
